Portfolio Website

<https://10neday.github.io/Portfolio/>

TECHNICAL SKILLS

- Microsoft Excel (VLOOKUP, Pivot Table, Data Summary)
- Google Sheets (Data Tracking and Reporting)
- Minitab (Basic DOE, ANOVA, Parameter Optimization)
- Express System (Inventory Data Management)
- Basic Supply Chain and Production Planning
- Basic Time Study and Process Improvement
- 7 QC Tools

SOFT SKILLS

- Analytical Thinking
- Problem Solving
- Attention to Detail
- Teamwork
- Willingness to Learn

LANGUAGES

- Thai: Native
- English: Basic to Intermediate

Thanawat Mato

Logistics Engineering Graduate | Warehouse, Production & Industrial Engineering

SUMMARY

Recent Logistics Engineering graduate with a strong interest in warehouse operations, production engineering, industrial engineering, and continuous improvement. Gained practical experience through a warehouse internship, including inventory data control, daily operation support, and process improvement. Able to use Excel, Minitab, 7 QC tools, and DOE to analyze problems and support data-driven improvement.

EDUCATION

King Mongkut's University of Technology North Bangkok (KMUTNB) 2026

Bachelor of Engineering in Logistics Engineering

GPA: 3.38

Relevant Coursework: Production Planning and Control, Industrial Work Study, Inventory and Warehouse Management, Quality Control, Operations Research, Plant Layout

EXPERIENCE

Warehouse Intern

Apr 2025 - Jun 2025

Chua Hah Seng Food Products Co., Ltd.

- Updated inventory data using Express system and Microsoft Excel to support stock accuracy.
- Supported daily warehouse operations, including receiving, withdrawal, transfer, and finished goods checking.
- Analyzed overstock issues and proposed improvement ideas to improve operational efficiency.
- Improved Work Instructions (WI) and observed workflow to identify process improvement opportunities.

PROJECT

Determining Appropriate Parameters in the Moisture Reduction Process of Biomass Wood Pellets

Senior Project

- Applied Fishbone Diagram, Cause & Effect Matrix, Pareto Chart, FMEA, DOE, and ANOVA to identify key factors affecting moisture content.
- Used Minitab to design and analyze a 2-level factorial experiment involving hot air temperature, feed rate, and drum dryer speed.
- Determined optimal process parameters of 54°C hot air temperature, 12 kg/min feed rate, and 6 rpm drum dryer speed.
- Reduced moisture values outside control limits from 81.25% to 6.25%, representing a 92.31% reduction.
